

Temple BSPH Internship in Infectious Disease Epidemiology and Research

The Wiens Lab in the Department of Epidemiology and Biostatistics at Temple University College of Public Health has exciting internship opportunities available in infectious disease research. Within our lab, we study infections and illnesses that often get missed in passive surveillance systems. Using disease modeling, sero-epidemiology, and spatial analysis, our primary objective is to understand the role mild or asymptomatic infections, as well as infections affecting individuals who lack access to healthcare, particularly in the context of cholera and diarrheal diseases.

Position description: Internships and legacy projects within the Wiens Lab are customized to align with students' unique skills and career aspirations. These opportunities encompass diverse areas, such as proposal writing and development, literature review, assessments of data quality and bias, and data analysis and visualization. Interns also have the chance to actively engage with collaborators on both local and global fronts, present their works-in-progress during team meetings, and hone their research skills and professional development to facilitate their progress towards future career goals. You can find more information about our research and the types of projects you can get involve in on our lab website: <https://wienslab.github.io>.

To apply: Submit your 1) CV or resume and 2) a cover letter to Dr. Kirsten E. Wiens at kirsten.wiens@temple.edu. In your cover letter, please describe why you are interested in interning *with us specifically* and include the types of projects that you would most like to contribute to. We look forward to receiving your application and the prospect of working together to advance our collective understanding of infectious diseases.
